

Oils

Neem Oil. One of the reasons I wrote this post is because during my research for last week's post on [neem oil](#), I learned that it can work indirectly to dissuade moles. That's because one of their main food sources is grubs. If you can decrease your grubs, you can decrease your moles. Neem oil can be effective against grubs, including the larval stage of Japanese beetles, so if you have a mole problem and a grub or Japanese beetle problem, neem oil may be the solution for you. That being said, using beneficial nematodes for grubs is a more tried and true strategy, so I recommend that over neem oil for now.
